1) Implement the First Come First Serve code and paste the output below.

```
#include <stdio.h>
#include <conio.h>
#include <stdlib.h>
int main()
{
    int bt[20], wt[20], tat[20], i, n;
    float wtavg, tatavg;
    system("cls");
    printf("\nEnter the number of processes-- ");
    scanf("%d", &n);
    for (i = 0; i < n; i++)
    {
        printf("\nEnter Burst Time for Process %d -- ", i);
        scanf("%d", &bt[i]);
    }
    wt[0] = wtavg = 0;
    tat[0] = tatavg = bt[0];

Conclusion;

Among the scheduling algorithms, **Shortest Job Next (SJN)** provides the best performance with the lowest Average Waiting Time (AWT) and Average Turnaround Time (ATAT), making it ideal for systems prioritizing quick task completion. **First-Come-First-Serve (FCFS)** is straightforward but can lead to longer waiting times for larger tasks. **Priority Scheduling** is effective for prioritizing critical processes but may increase waiting time for lower-priority tasks. **Round Robin (RR)** ensures fairness and responsiveness in time-shared systems but has slightly higher overhead due to frequent context switching. The choice of the algorithm depends on the system's specific requirements for fairness, efficiency, and priority handling.
